

Elaboration of assessment system of the criterion: the contribution to the ecology of the North Sea;

Regulations for granting permits for offshore wind energy lot **VI** Hollandse Kust (west)

September 1, 2022

In the context of assessing the contribution of the wind farm to the ecology of the North Sea, RVO wishes to obtain insight into the quality in the investments and innovations of each application within lot VI for the contribution to the ecology of the North Sea as described in the Regulation of the Minister of Economic Affairs and Climate of March 9, 2022, no. WJZ/ 21307522, containing further rules for the licensing of wind energy at sea for lot V of the wind energy area Hollandse Kust (north).

1 Stimulating investments in the wind farm on plot VI in addition to prescribed measures in the plot decision VI Hollandse Kust (west) for the benefit of the biodiversity naturally occurring in the Dutch North Sea (species, populations and habitats)

(max 40 points)

Qualitative measures	Assessment measure	Subcategories	Pt.		Supplemental
The investments contribute (potentially) to: limiting negative impacts on the conservation of species and populations protected under the EU Birds (VR) and Habitats (HR)	Potential impact of investment for the wind farm on Lot VI on: limiting negative impacts on the conservation of species and populations (VR/ HR). or	The potential impact of the investments on reducing or preventing adverse effects on the populations referred to in Section 7.5.8. of Plot Decision VI Hollandse Kust (west) of the populations of the species listed in Annex I of the plot decision listed species	0-6	0 - 30	This will take into account the ecological relevance as described in the Plot Decision and EIA.

Directives or • promoting positive effects on the conservation of marine habitat types of EU Habitats Directive or • promoting positive effects on environmental status (EU Marine Framework Directive Strategy; KRM) in the Dutch	• promoting the conservation of marine habitat types (HR) and/or of (MSFD; fish community; benthic habitats) in the Dutch North Sea.	The potential impact of investment in promoting: • A nationally favorable conservation status of marine habitat types H1110 or H1170 (HR) or • of good environmental status (MSFD) in the Dutch North Sea for fish community (overarching or D1C2 or D1C3)	0-4		
--	--	---	-----	--	--

North Sea for "fish community" and/or "benthic habitats." The investments are integrated into the design, construction and operation of the generating plant to be constructed by Licensee (which includes the erosion protective pavement and park wiring) within the wind farm on Lot VI. The permitted (range of) turbine sizes, the number of turbines and the maximum rotor area per lot, as bindingly stipulated in regulation 3 of the lot decision, are not taken into account. The investment must be in operation no later than 60 months after the permit becomes irrevocable taken.		or for benthic habitats (overarching or D6C3 or D6C5), as formulated in Marine Strategy, Part 1 (2018)			
	The extent to which it is plausible that the investment can be successfully applied in an operational environment		0-10		This will include consideration of: - technical plausibility - Whether and to what extent a party has considered potential licensability
	The extent to which it is understood what specific, measurable and time-bound progress the investment will have and how it will be communicated upon implementation of the investment		0-10		

The extent to which knowledge and experience is shared across investments. The intended ecological knowledge and experience is relevant to: • seeking to limit negative impacts on the conservation of species and populations protected under the EU Birds Directive (VR) and Habitats Directive (HR) or • promoting positive effects on the conservation of marine habitat types of EU Habitats Directive or • promoting positive effects on environmental status (EU Marine Framework Directive Strategy; KRM) in the Dutch North Sea for "fish community" and/or "benthic habitats."	The extent to which knowledge and experience contributes to knowledge gaps (including from the Lot VI EIA) and takes place in good coherence with existing research projects			0 - 10	This will include consideration of the degree of: - accessibility - openness (including completeness and availability of underlying data)
	The quality of a dissemination and communication plan, including the extent to which the dissemination and communication plan describes the knowledge to be shared, specifically, measurably and time-bound; and the extent to which the target audiences are named and the resources to match.				

2 To encourage innovation and the development of solutions for the benefit of biodiversity naturally occurring in the Dutch North Sea (species, populations and habitats) from the wind farm on Lot VI of and future Dutch offshore wind farms **(max. 60 points)**

Qualitative measures	Assessment measure	Subcategories	Pt.		Supplemental
A contribution to the development or demonstration of innovative solutions for: - mitigation of negative effects on the conservation of species and populations protected under the EU Birds (VR) and Habitats (HR) Directives or - enhancing positive effects on the conservation of marine habitat types of EU Habitats Directive or - promoting positive effects on environmental status (EU Marine Framework Directive Strategy; MSFD) in the Dutch North Sea for "fish community" and/or "benthic habitats" For each demonstration, at least a prototype in an operational environment (TRL7) in the form of a pilot must exist at the time of the demonstration.	Potential impact of the contribution to the development or demonstration of the innovation from the wind farm on Lot VI and offshore wind farms in the future if the innovation is made marketable on: limiting negative impacts on the conservation of species and populations (VR/ HR).	The potential impact of the innovation or knowledge development on reducing or preventing negative impacts on the in section 7.5.8.of Plot Decision VI Hollandse Kust (west) populations of the species listed in Annex I of the Plot Decision	0 - 12	0 - 50	This will include consideration of: - ecological relevance as described in the Plot Decision and EIR - scalability - universal applicability
	or	The potential impact of the innovation or knowledge development on promoting: - A nationally favorable conservation status of marine habitat types H1110 or H1170 (HR) or - good environmental status (MSFD) in the Dutch North Sea for fish community (overarching or D1C2 or D1C3) or benthic habitats (overarching or D6C3 or D6C5, as formulated in Marine Strategy, Part 1 (2018)).	0 - 6		
	The degree to which the innovation is innovative and inventive relative to the best products, services or		0-8		

Other innovations and solutions not to be captured by a TRL level should be sufficiently developed for application in an operational environment.	processes				
Solutions demonstration and applications must be in operation no later than 60 months after irrevocable authorization.	The extent to which the innovation is based on the most current scientific understanding at the time the application is submitted		0-8		
The innovations have been integrated into the design, construction and operation of the generating facility to be constructed by Licensee (which includes the erosion-protective pavement and park wiring) within the wind farm on Lot VI.	The extent to which it is plausible that the innovation can be successfully applied in an operational environment, on the one hand by substantiation from the literature, and on the other hand by monitoring effectiveness after construction of the pilot		0-8		This will include consideration of: - technical plausibility - Whether and to what extent a party has considered potential licensability, - process description
The permitted (range of) turbine sizes, the number of turbines and the maximum rotor area per lot, as bindingly stipulated in regulation 3 of the lot decision, are not taken into account.	The extent to which it is understood what specific, measurable and time-bound progress the demonstration will have and how it will be communicated upon implementation of the innovation		0-8		

The extent to which knowledge and experience is shared about the innovation being demonstrated The intended ecological knowledge and experience is relevant to: • seeking to limit negative impacts on the conservation of species and populations protected under the EU Birds Directive (VR) and Habitats Directive (HR) or • promoting positive effects on the conservation of marine habitat types of EU Habitats Directive or • promoting positive effects on environmental status (EU Marine Framework Directive strategy; KRM) in the Dutch North Sea for "fish community" and/or "benthic habitats." The contribution must be additional to or in close coordination with existing research at the time the application is submitted.	The extent to which knowledge and experience contributes to knowledge gaps (including from the Lot VI EIA) and takes place in good coherence with existing research projects			0 - 10	This will include consideration of: - the degree of accessibility - openness (including completeness and availability of underlying data)
	The quality of a dissemination and communication plan, including the extent to which the dissemination and communication plan describes the knowledge to be shared, specifically, measurably and time-bound; and the extent to which the target audiences are named and the resources to match them				

Indicative values on a continuous scale from 0 to 100 in percent for the criteria. Keeping in mind that this is a comparative test, i.e. a weighting of applications against each other.

indicative intermediate values on a continuous scale	
Excellent, value-added	100%
Very good, with some added value	90%
Good	80%
Ample	70%
Sufficient	60%
Moderate	50%
Insufficient	40%
More than insufficient	30%
Bad	20%
Very bad	10%
